

Executive Summary: Colorado Zillow Housing Map

This interactive map displays Zillow housing listings across Colorado using spatial point data. Each point represents one home listing, placed according to its latitude and longitude. The map is designed to help users visually explore where homes are located, how listing prices vary across space, and how different home types are distributed throughout the state.

The map uses a clean CartoDB.Positron basemap, and homes are colored by home type: single-family homes, townhouses, and condos. In this dataset, single-family homes appear to make up most of the listings and are spread across many areas, while condos and townhouses appear less frequently and are more concentrated in certain urban or suburban locations.

The size of each point represents the listing price. Larger circles indicate higher-priced homes, while smaller circles indicate lower-priced homes. One interesting pattern is that some of the largest circles appear in mountain or resort-related areas, such as around Aspen and Boulder; At the same time, many listings are clustered around Denver, Colorado Springs, Boulder, and Fort Collins, showing that the housing data is strongly concentrated along Colorado's Front Range urban corridor.

Finally, the map includes layer controls that allow users to turn single-family homes, townhouses, and condos on or off. This filtering feature helps users gain better insight by examining one home type at a time or comparing multiple home types together. Overall, the map reveals both geographic and housing-market patterns in the Colorado Zillow data, especially the concentration of listings in major urban areas, the dominance of single-family homes, and the presence of high-priced listings in selected mountain and metro locations.
